

---

# 2nd Belgian-Dutch workshop on **Software Evolution**

BENEVOL 2004

8-9 July 2004  
University of Antwerp  
Belgium

---

**UMH**

# Problem statement

---

- More and better **tool support** needed for software evolution
  - traceability management
  - version control (e.g., software merging)
  - impact analysis
  - change propagation
  - consistency maintenance
  - model transformation
  - co-evolution
  - analysing release histories
  - a "theory of software evolution"
- **Formalisms** can be helpful for some of these tools

---

Critical pair analysis  
of graph transformations  
for software refactoring

Tom Mens

Service de Génie Logiciel  
Université de Mons Hainaut

<http://www.umh.ac.be/~genlog>

# Case study: Graph transformation

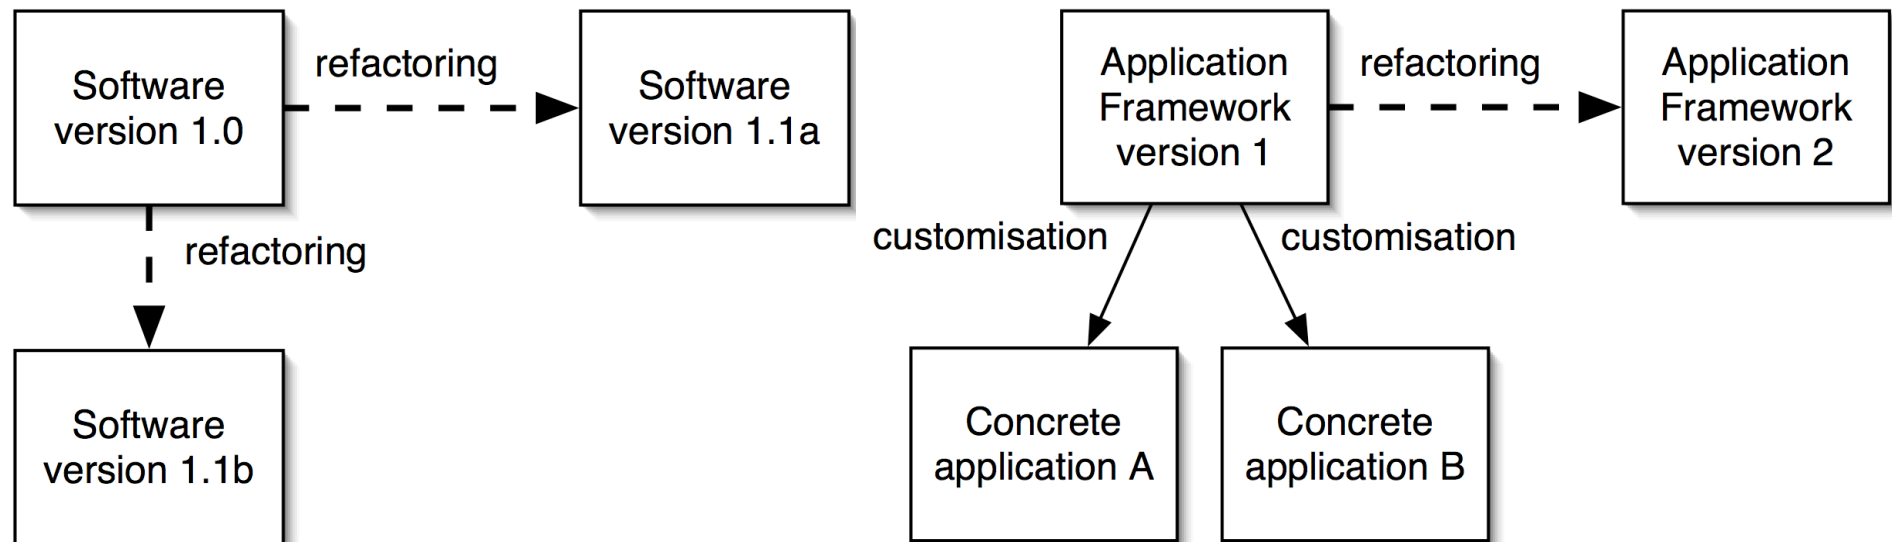

---

- Formalism based on
  - **graphs**: to represent software entities
  - **graph transformation**: to represent software evolution
  - offers many theoretical results that can help during analysis
    - type graph, negative application conditions, parallel and sequential (in)dependence, confluence, critical pair analysis
- Experiment: use graph transformation theory to **detect and resolve structural conflicts when refactorings are applied in parallel**
  - Use AGG tool for experiments
  - in collaboration with Gabi Taentzer, Berlin

# Case study: Graph transformation

---

- Two concrete scenarios

# Case study: AGG

AGG V1.2.1

Node Type:  Parameter

Edge Type: — accesses

**noSetter**

```

    graph TD
      C2[2:Class] -- contains --> M1[Method name=s]
  
```

**EncapsulateVariable of Refactorings**

```

    graph TD
      C2[2:Class] -- 4:contains --> V1[1:Variable name=v visibility="public"]
      V1 -- 5:type --> C3[3:Class]
      C2 -- 4:contains --> M2[Method name="set"+v visibility="public"]
      C2 -- 4:contains --> M3[Method name="get"+v visibility="public"]
      M2 -- contains --> P[Parameter name="p"]
      M3 -- updates --> V1
      M3 -- accesses --> V1
      M3 -- type --> C3
      P -- type --> C3
  
```

# Case study: critical pair analysis

---

- Use critical pair analysis in *AGG*
  - $T_1$  and  $T_2$  form a *critical pair* if
    - they can both be applied to the same initial graph  $G$  but
    - applying  $T_1$  prohibits application of  $T_2$  and/or vice versa

# Case study: parallel refactorings

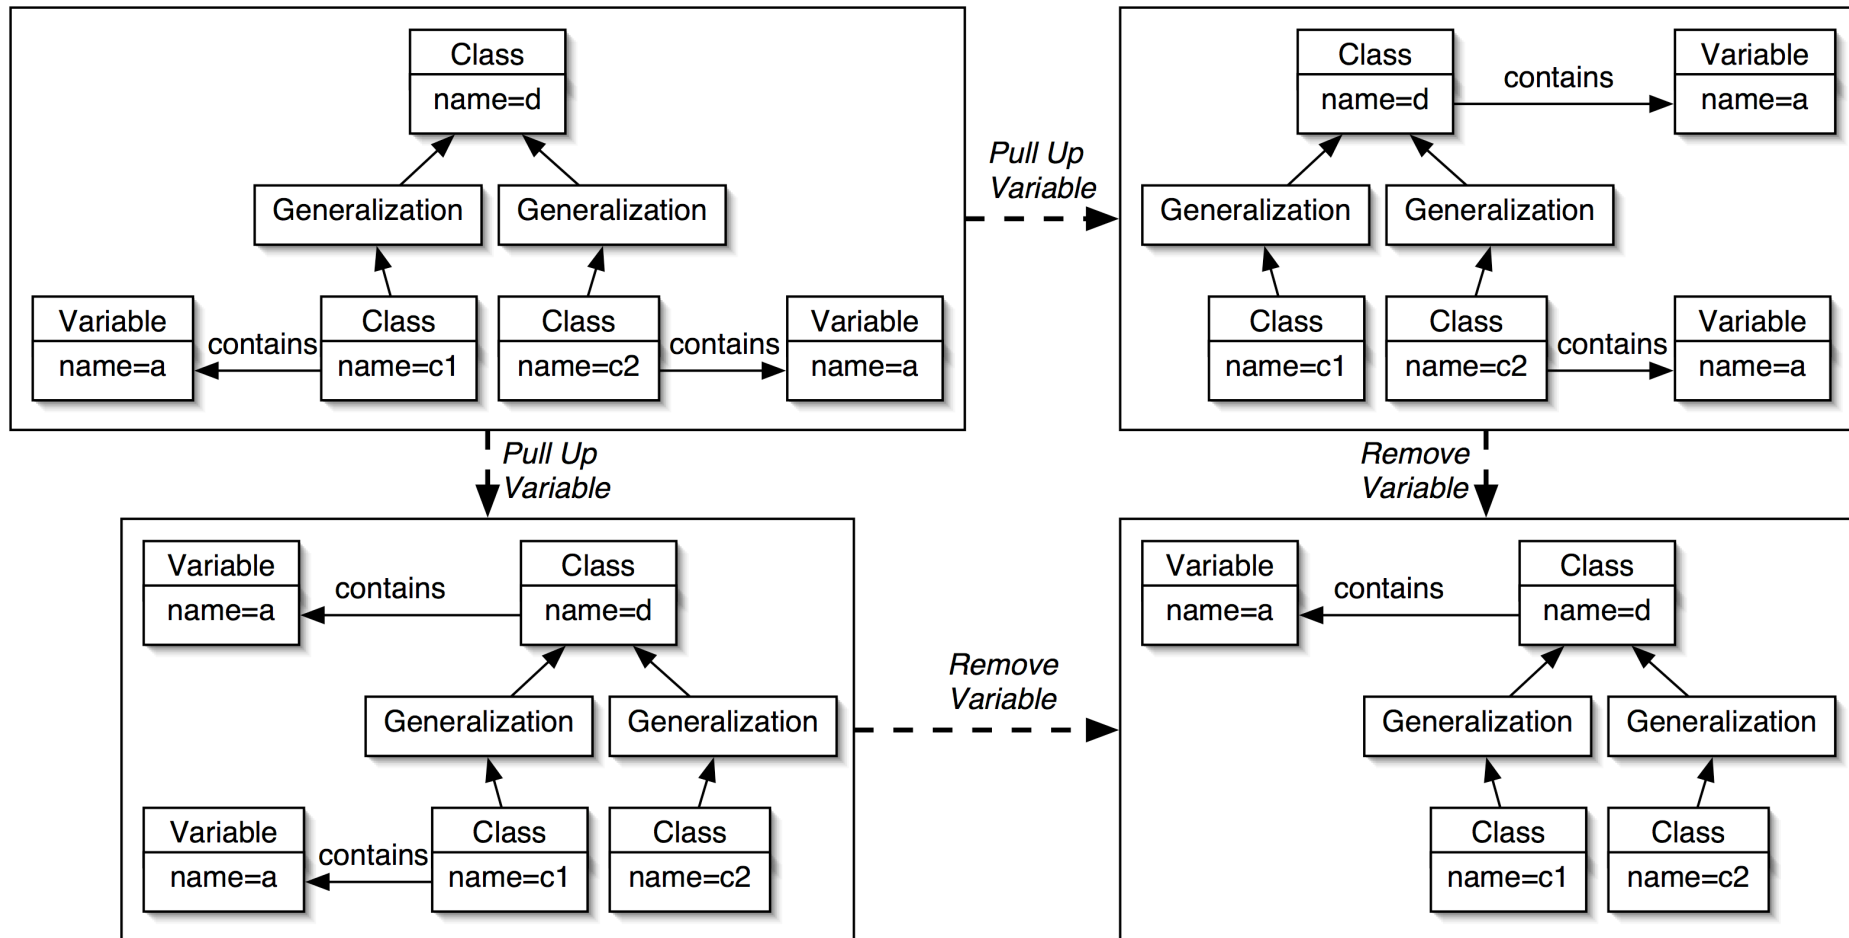

- Compute critical pairs for 9 representative refactorings

first \ second	1: MoveV...	2: PullUp...	3: Encaps...	4: MoveM...	5: PullUp...	6: CreateS...	7: Renam...	8: Renam...	9: Renam...
1: MoveVariable	3	4	2	0	0	0	2	0	0
2: PullUpVariable	4	2	2	0	0	0	2	0	0
3: EncapsulateVariable	2	2	2	2	2	0	0	1	0
4: MoveMethod	0	0	2	3	4	0	0	2	0
5: PullUpMethod	0	0	2	4	2	0	0	2	0
6: CreateSuperclass	0	1	0	0	1	4	0	0	3
7: RenameVariable	1	1	1	0	0	0	2	0	0
8: RenameMethod	0	0	0	1	1	0	0	2	0
9: RenameClass	0	0	0	0	0	3	0	0	2

# Case study: parallel refactorings

- Perform confluence analysis to resolve detected conflicts

# Case study: parallel refactorings

---

- To do
  - Improve performance of critical pair analysis algorithm
  - Find out to which extent conflict resolution can be automated
  - Reduce set of critical pairs
    - e.g. by taking into account transitive closure of inheritance
  - Investigate distinction between symmetric and asymmetric conflicts

# Case study: framework customisation

---

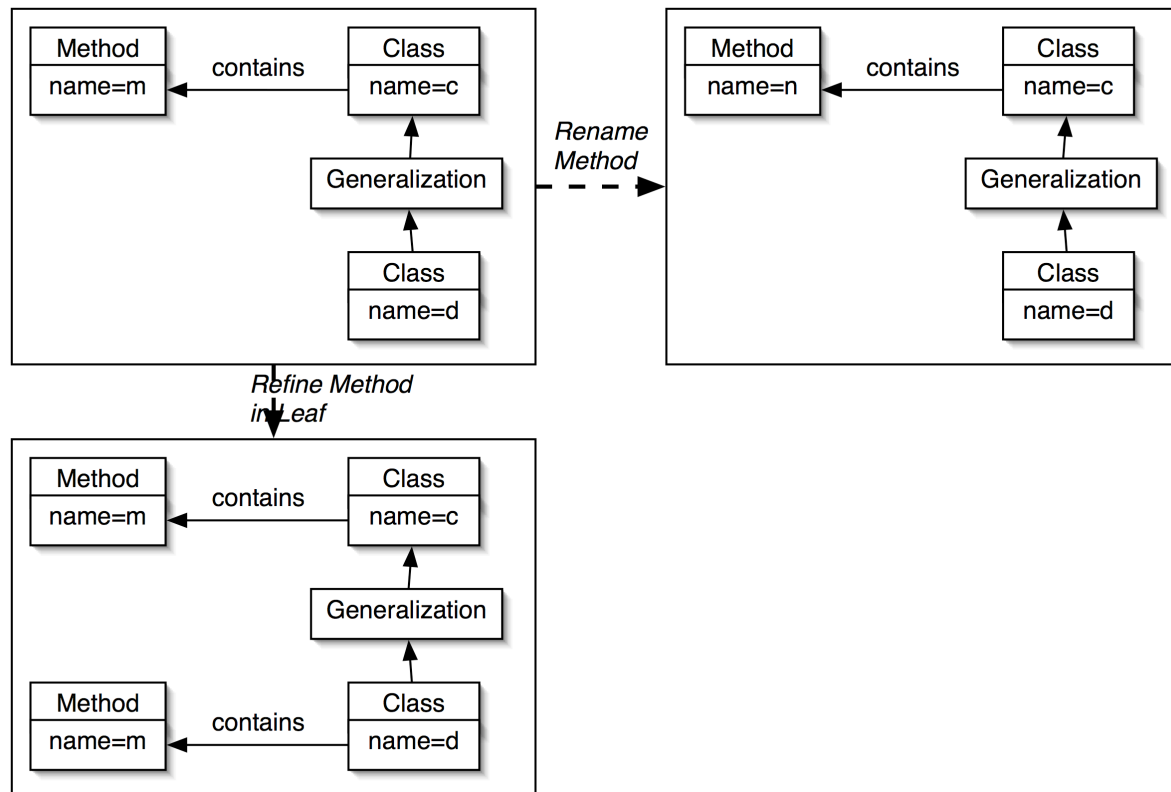

- Customisation conflicts due to framework refactoring

The screenshot shows a software interface with a grid of buttons and a list of refactorings. The buttons are arranged in a 9x4 grid. The first four columns are labeled '10: AddLe...', '11: AddV...', '12: AddM...', and '13: Refine...'. The buttons contain numerical values. The first four columns are highlighted in green, and the last column is highlighted in red. The list of refactorings is on the right side of the interface.

10: AddLe...	11: AddV...	12: AddM...	13: Refine...	first \ second
0	1	0	0	1: MoveVariable
0	0	0	0	2: PullUpVariable
0	0	1	3	3: EncapsulateVariable
0	0	1	6	4: MoveMethod
0	0	0	5	5: PullUpMethod
2	0	0	1	6: CreateSuperclass
0	1	0	0	7: RenameVariable
0	0	1	1	8: RenameMethod
1	0	0	0	9: RenameClass

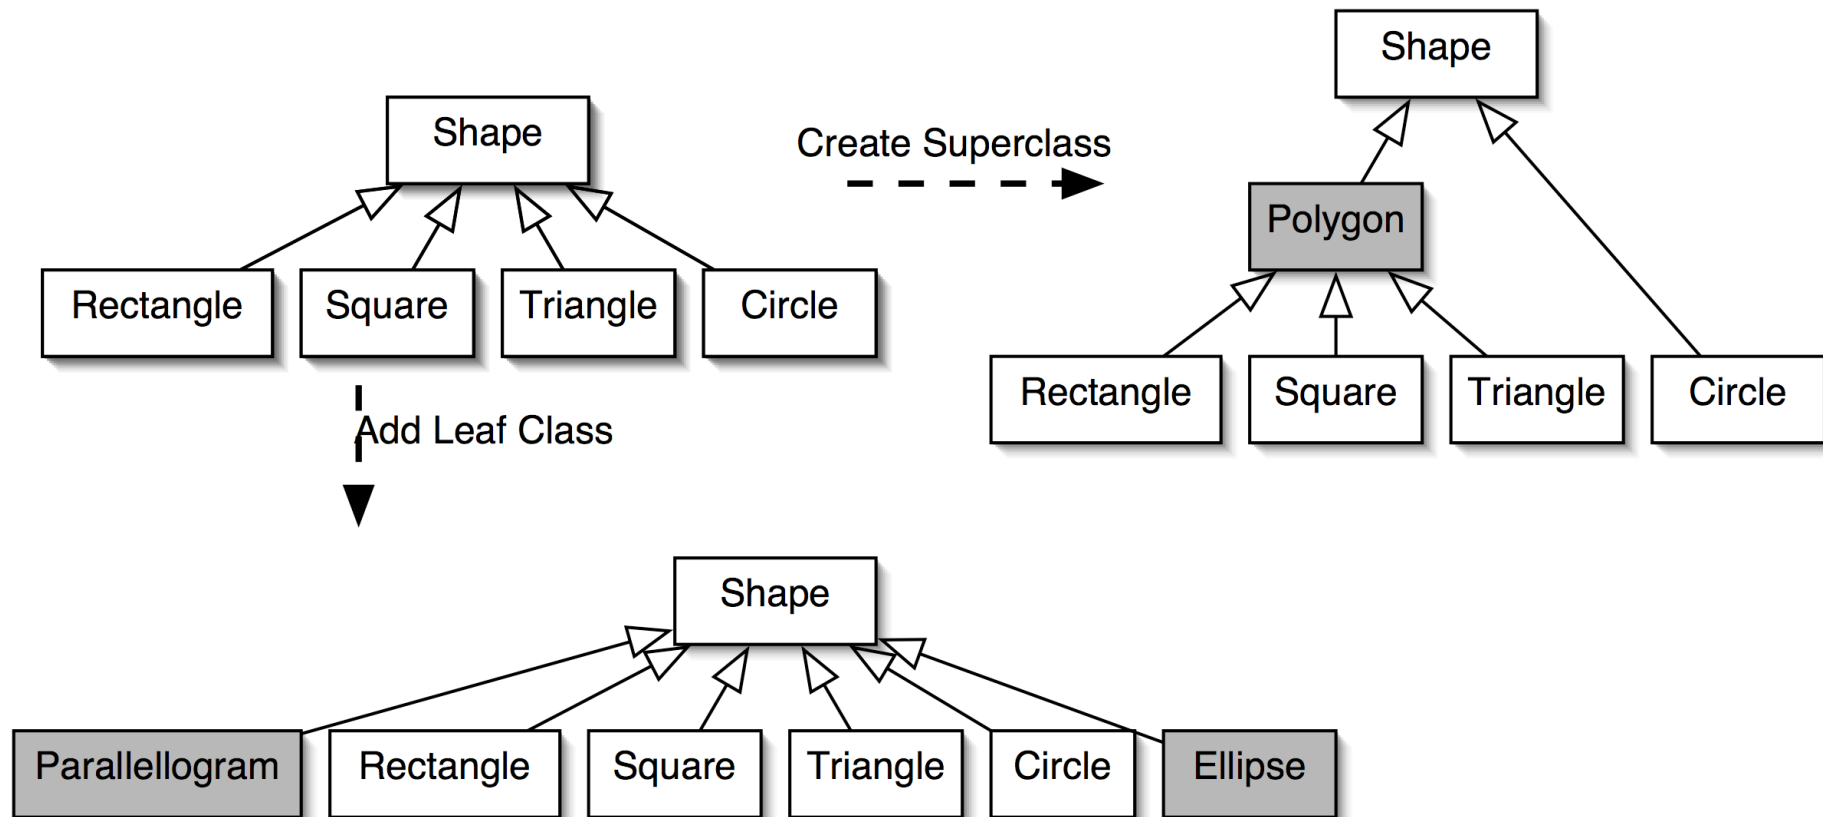

# Case study: framework customisation

- Customisation conflicts due to framework refactoring

# Case study: Open question

- How to deal with semantic conflicts?

# Case study: another potential scenario

---

- Use some tool to detect "bad smells"
  - opportunities for refactoring
  - can be used to propose a list of possible refactorings that can be applied in the same context
    - cf. Mens&Tourwé, CSMR 2003 and IWPSE 2003
- Critical pair analysis can be used to
  - identify which of the refactorings in this list are in conflict
  - suggest a non-conflicting sequence of refactorings that removes the detected bad smells

---

# Formal foundations for software evolution

Tom Mens

Software Engineering Lab  
University of Mons-Hainaut  
<http://www.umh.ac.be/~genlog>

# Example: Refactoring formalisms

---

- **Question**

- which formalisms can be used to improve tool support for refactoring?

- **Answers**

- Graph transformation
- Logic formalisms
  - description logic, fuzzy logic, temporal logic, ...
- Software metrics
- Formal concept analysis
- Program slicing
- Denotational semantics

# Fundamental Research Questions

---

- possible uses of **graph transformation** to assist with **refactoring** ?
  - How to (de)compose refactorings ?
  - How to detect and resolve conflicts due to refactorings ?
    - critical pair analysis
  - How to deal with co-evolution ?
    - triple (quadruple) graph grammars
  - How to guarantee "behaviour preserving" ?
  - How to guarantee "structure improving" ?

# Fundamental Research Questions

---

- other formalisms to assist with refactoring?
  - formal concept analysis
  - program slicing
  - description logics
  - ...
- What is behaviour ? Behaviour preserving ?
  - real-time systems (time); embedded systems (power & memory); safety critical systems (liveness, ...)
  - What are good program invariants ? How to express them ?
- What is structure ? Structure improving ?
  - How to measure impact/effect of refactoring on software quality ?
- Co-evolution
  - How to address consistency maintenance and change propagation ?
    - code  $\Leftrightarrow$  design  $\Leftrightarrow$  architecture  $\Leftrightarrow$  requirements
  - How to refactor at higher abstraction levels ?
    - UML models, design patterns, architectures, components

# Practical Questions

---

- How to measure complexity of refactorings ?
  - Comparing different refactorings in same formalism
  - Comparing same refactoring in different formalisms
  - computational complexity of preconditions
  - computational complexity of applying the refactoring
  - readability/understandability of the refactoring
- How can we determine where and why to refactor ?
  - bad smells
- Where does refactoring fit in the development process ?
- How to combine refactoring with other techniques ?
  - design patterns, application frameworks, aspect-oriented programming, generative programming, ...

# Opportunities for collaboration

---

- Applying refactorings to UML models
  - Fits in the MDA model transformation context
  - Addresses theoretical and practical aspects
    - Theoretical
      - deciding on an appropriate formalism ; subset of UML ; definition of behaviour
    - Practical
      - developing tools / plug-ins for model refactoring
- Opportunities
  - Suggest as a topic for ERCIM Strategy 2004
  - Propose a small-scale European project (possible with support from ERCIM)
    - academic partners: UA, UMH, CWI, ... ?
    - industrial partners ?
